COMBINATION WITH EXISTING HEATING SYSTEM

Green part of SENKO cookers

By photosynthesis of water, earthy minerals and carbon dioxide (CO₂), with the help of sun energy, grows the tree. During combustion, heat, water, CO₂ and minerals (ash) are released. Wood is stored sun energy! Thanks to this cycle of overgrow, the wood is completely environmentally friendly fuel. SENKO cookers fully meet the environmental standards and are ideal for fuel combustion in this energy cycle.

Construction solutions and intake of secondary air into the firebox provide an **additional fuel efficiency and combustion of harmful gases**. In this way SENKO cookers fully comply with environmental standards and enable wood burning process described by the SENKO GREEN LABEL.
